Unit C: Knowledge Representation & Reasoning

Propositional logic in Artificial intelligence

Propositional logic (PL) is the simplest form of logic where all the statements are made by propositions. A proposition **is a declarative statement** which is **either true or false**. It is a technique of knowledge representation in logical and mathematical form.

Example:

- 1. a) It is Sunday.
- 2. b) The Sun rises from West (False proposition)
- 3. c) 3+3= 7(False proposition)
- 4. d) 5 is a prime number.

Following are some basic facts about propositional logic:

- Propositional logic is also called Boolean logic as it works on 0 and 1.
- In propositional logic, we use symbolic variables to represent the logic, and we can use any symbol for a representing a proposition, such A, B, C, P, Q, R, etc.
- Propositions can be either true or false, but it cannot be both.
- Propositional logic consists of an object, relations or function, and **logical connectives**.
- These connectives are also called logical operators.
- The propositions and connectives are the basic elements of the propositional logic.
- Connectives can be said as a logical operator which connects two sentences.
- A proposition formula which is always true is called tautology, and it is also called a valid sentence.
- A proposition formula which is always false is called **Contradiction**.
- A proposition formula which has both true and false values is called
- Statements which are questions, commands, or opinions are not propositions such as "Where is Rohini", "How are you", "What is your name", are not propositions.

Syntax of propositional logic:

The syntax of propositional logic defines the allowable sentences for the knowledge representation. There are two types of Propositions:

- 1. Atomic Propositions
- 2. Compound propositions
- Atomic Proposition: Atomic propositions are the simple propositions. It consists of a single proposition symbol. These are the sentences which must be either true or false.

Example:

- 1. a) 2+2 is 4, it is an atomic proposition as it is a true fact.
- 2. b) "The Sun is cold" is also a proposition as it is a false fact.

• **Compound proposition:** Compound propositions are constructed by combining simpler or atomic propositions, using parenthesis and logical connectives.

Example:

- 1. a) "It is raining today, and street is wet."
- 2. b) "Ankit is a doctor, and his clinic is in Mumbai."

Logical Connectives:

Logical connectives are used to connect two simpler propositions or representing a sentence logically. We can create compound propositions with the help of logical connectives. There are mainly **five connectives**, which are given as follows:

- 1. **Negation:** A sentence such as ¬ P is called negation of P. A literal can be either Positive literal or negative literal.
- 2. Conjunction: A sentence which has Λ connective such as, $P \wedge Q$ is called a conjunction.

Example: Rohan is intelligent and hardworking. It can be written as,

P= Rohan is intelligent,

Q= Rohan is hardworking. \rightarrow PA Q.

3. **Disjunction:** A sentence which has V connective, such as **P V Q**. is called disjunction, where P and Q are the propositions.

Example: "Ritika is a doctor or Engineer",

Here P= Ritika is Doctor.

Q= Ritika is Engineer, so we can write it as **P V Q**.

4. **Implication:** A sentence such as $P \rightarrow Q$, is called an implication. Implications are also known as if-then rules. It can be represented as

If it is raining, then the street is wet.

Let P= It is raining, and Q= Street is wet, so it is represented as $P \rightarrow Q$

5. **Biconditional:** A sentence such as **P**⇔ **Q** is a **Biconditional sentence**, example If I am breathing, then I am alive

P= I am breathing, Q= I am alive, it can be represented as $P \Leftrightarrow Q$.

Following is the summarized table for Propositional Logic Connectives:

Connective symbols	Word	Technical term	Example
Λ	AND	Conjunction	AΛB
V	OR	Disjunction	AVB
\rightarrow	Implies	Implication	$A \rightarrow B$
\Leftrightarrow	If and only if	Biconditional	A⇔ B
¬or∼	Not	Negation	¬ A or ¬ B

Truth Table:

In propositional logic, we need to know the truth values of propositions in all possible scenarios. We can combine all the possible combination with logical connectives, and the representation of

these combinations in a tabular format is called **Truth table**. Following are the truth table for all logical connectives:

For Negation:

P	٦P	
True	False	
False	True	

For Conjunction:

P	Q	P∧ Q
True	True	True
True	False	False
False	True	False
False	False	False

For disjunction:

P	Q	PVQ.
True	True	True
False	True	True
True	False	True
False	False	False

For Implication:

P	Q	P→ Q
True	True	True
True	False	False
False	True	True
False	False	True

For Biconditional:

P	Q	P⇔ Q
True	True	True
True	False	False
False	True	False
False	False	True

Truth table with three propositions:

We can build a proposition composing three propositions P, Q, and R. This truth table is made-up of 8n Tuples as we have taken three proposition symbols.

Р	Q	R	¬R	PvQ	PvQ→¬R
True	True	True	False	True	False
True	True	False	True	True	True
True	False	True	False	True	False
True	False	False	True	True	True
False	True	True	False	True	False
False	True	False	True	True	True
False	False	True	False	False	True
False	False	False	True	False	True

Precedence of connectives:

Just like arithmetic operators, there is a precedence order for propositional connectors or logical operators. This order should be followed while evaluating a propositional problem. Following is the list of the precedence order for operators:

Precedence	Operators
First Precedence	Parenthesis
Second Precedence	Negation
Third Precedence	Conjunction(AND)
Fourth Precedence	Disjunction(OR)
Fifth Precedence	Implication
Six Precedence	Biconditional

Note: For better understanding use parenthesis to make sure of the correct interpretations. Such as $\neg RVQ$, It can be interpreted as $(\neg R)VQ$.

Logical equivalence:

Logical equivalence is one of the features of propositional logic. Two propositions are said to be logically equivalent if and only if the columns in the truth table are identical to each other.

Let's take two propositions A and B, so for logical equivalence, we can write it as $A \Leftrightarrow B$. In below truth table we can see that column for $\neg AV$ B and $A \rightarrow B$, are identical hence A is Equivalent to B

Α	В	¬A	¬A∨ B	A→B
T	T	F	Т	Т
Т	F	F	F	F
F	T	Т	Т	Т
F	F	T	Т	Т

Properties of Operators:

- Commutativity:
 - \circ PA Q= Q A P, or
 - \circ PVQ=QVP.
- Associativity:
 - o $(P \land Q) \land R = P \land (Q \land R),$
 - \circ (P V Q) V R= P V (Q V R)
- Identity element:
 - P Λ True = P,
 - P V True= True.
- Distributive:
 - \circ PA (Q V R) = (P A Q) V (P A R).
 - 2*(3+4)=(2*3)+(2*4) \circ PV(Q \wedge R) = (PVQ) \wedge (PVR). 2+(3*4)=(2+3)*(2+4)
- DE Morgan's Law:
 - \circ $\neg (P \land Q) = (\neg P) \lor (\neg Q)$
 - \circ \neg (P V Q) = (\neg P) \land (\neg Q).
- **Double-negation elimination:**
 - \circ \neg $(\neg P) = P$.

Limitations of Propositional logic:

- We cannot represent relations like ALL, some, or none with propositional logic. Example:
 - 1. All the girls are intelligent.
 - 2. Some apples are sweet.
- Propositional logic has limited expressive power.
- In propositional logic, we cannot describe statements in terms of their properties or logical relationships.

Rules of Inference in Artificial intelligence

Inference:

In artificial intelligence, we need intelligent computers which can create new logic from old logic or by evidence, so generating the conclusions from evidence and facts is termed as Inference.

Inference rules:

Inference rules are the templates for generating valid arguments. Inference rules are applied to derive proofs in artificial intelligence, and the proof is a sequence of the conclusion that leads to the desired goal.

In inference rules, the implication among all the connectives plays an important role. Following are some terminologies related to inference rules:

- Implication: It is one of the logical connectives which can be represented as P → Q. It is a Boolean expression.
- Inverse: The negation of implication is called inverse. It can be represented as $\neg P \rightarrow \neg Q$.
- **Converse:** The converse of implication, which means the right-hand side proposition goes to the left-hand side and vice-versa. It can be written as Q → P.
- **Contrapositive:** The negation of converse is termed as contrapositive, and it can be represented as $\neg Q \rightarrow \neg P$.

From the above term some of the compound statements are equivalent to each other, which we can prove using truth table:

P	Q	P → Q	Q→ P	$\neg Q \rightarrow \neg P$	$\neg P \rightarrow \neg Q$.
т	т	т	т	т	т
т	T T	E	T	T T	т
E	T	r	T	r T	7
7	1	1	F	1	r
F	F	Т	T	T	T

Hence from the above truth table, we can prove that $P \to Q$ is equivalent to $\neg Q \to \neg P$, and $Q \to P$ is equivalent to $\neg P \to \neg Q$.

Types of Inference rules:

1. Modus Ponens:

The Modus Ponens rule is one of the most important rules of inference, and it states that

if P and P \rightarrow Q is true, then we can infer that Q will be true.

It can be represented as:

Notation for Modus ponens: $P \rightarrow Q$, $P \rightarrow Q$

Example:

Statement-1: "If I am sleepy then I go to bed" \Longrightarrow P \longrightarrow Q

Statement-2: "I am sleepy" ==> P

Conclusion: "I go to bed." \Longrightarrow Q.

Hence, we can say that, if $P \rightarrow Q$ is true and P is true then Q will be true.

Proof by Truth table:

Р	Q	P → Q
0	0	0
0	1	1
1	0	0
1	1	1 ←

2. Modus Tollens:

The Modus Tollens rule state that

if $P \rightarrow Q$ is true and $\neg Q$ is true, then $\neg P$ will also true.

It can be represented as:

Notation for Modus Tollens: $\frac{P \rightarrow Q, \ \sim Q}{\sim P}$

Statement-1: "If I am sleepy then I go to bed" \Longrightarrow P \longrightarrow Q

Statement-2: "I do not go to the bed."==> \sim Q

Conclusion: Which infers that "I am not sleepy" $=> \sim P$

Proof by Truth table:

Р	Q	~ <i>P</i>	~ <i>Q</i>	$P \rightarrow Q$
0	0	1	1	1 ←
0	1	1	0	1
1	0	0	1	0
1	1	0	0	1

3. Hypothetical Syllogism:

The Hypothetical Syllogism rule state that

if $P \rightarrow R$ is true whenever $P \rightarrow Q$ is true, and $Q \rightarrow R$ is true.

It can be represented as the following notation:

Example:

Statement-1: If you have my home key then you can unlock my home. $P \rightarrow Q$ **Statement-2:** If you can unlock my home then you can take my money. $Q \rightarrow R$ **Conclusion:** If you have my home key then you can take my money. $P \rightarrow R$

Proof by truth table:

Р	Q	R	P o Q	$Q \rightarrow R$	P	r o R	
0	0	0	1	1	1	←	
0	0	1	1	1	1	•	
0	1	0	1	0	1		
0	1	1	1	1	1	4	
1	0	0	0	1	1		
1	0	1	0	1	1		
1	1	0	1	0	0		
1	1	1	1	1	1	•	

4. Disjunctive Syllogism:

The Disjunctive syllogism rule state that

if PVQ is true, and ¬P is true, then Q will be true.

It can be represented as:

Notation of Disjunctive syllogism:
$$\frac{P \lor Q, \neg P}{Q}$$

Example:

Statement-1: Today is Sunday or Monday. ==>PVQ

Statement-2: Today is not Sunday. $\Longrightarrow \neg P$ **Conclusion:** Today is Monday. $\Longrightarrow Q$

Proof by truth-table:

Р	Q	$\neg P$	$P \lor Q$
0	0	1	0
0	1	1	1 -
1	0	0	1
1	1	0	1

5. Addition:

The Addition rule is one the common inference rule, and it states that If P is true, then PVQ will be true.

Notation of Addition:
$$\frac{P}{P \vee Q}$$

Example:

Statement: I have a vanilla ice-cream. ==> P **Statement-2:** I have Chocolate ice-cream.

Conclusion: I have vanilla or chocolate ice-cream. ==> (PVQ)

Proof by Truth-Table:

Р	Q	$P \lor Q$
0	0	0
1	0	1 4
0	1	1
1	1	1

6. Simplification:

The simplification rule state that

if PAQ is true, then Q or P will also be true.

It can be represented as:

Notation of Simplification rule:
$$\frac{P \wedge Q}{Q}$$
 Or $\frac{P \wedge Q}{P}$

Proof by Truth-Table:

Р	Q	$P \wedge Q$
0	0	0
1	0	0
0	1	0
1	1	1

7. Resolution:

The Resolution rule state that

if PVQ and ¬ PAR is true, then QVR will also be true.

It can be represented as

Notation of Resolution
$$Q \lor R$$

Proof by Truth-Table:

Р	⇒P	Q	R	$P \lor Q$	¬ P∧R	$Q \lor R$
0	1	0	0	0	0	0
0	1	0	1	0	0	1
0	1	1	0	1	1	1 ←
0	1	1	1	1	1	1 ←
1	0	0	0	1	0	0
1	0	0	1	1	0	1
1	0	1	0	1	0	1
1	0	1	1	1	0	1 -
